Adjacent to the PV subsystem is the energy storage unit, serving as a buffer between energy generation and consumption. The ...

The technology enables charging the batteries of electric vehicles and transferring the stored energy back to the stationary storage system in the building or to the grid when ...

As a representation of a larger charging node, this paper focuses on the case of an airport where a scheduled fleet of battery-electric aircraft relies on charging. Necessary simulation models ...

The Bidirectional Charging project, which began in May 2019, aimed to develop an intelligent bidirectional charging management system and associated EV components to ...

The objective of this article is to propose a photovoltaic (PV) power and energy storage system with bidirectional power flow control and hybrid charging strategies.

Following the societal electrification trend, airports face an inevitable transition of increased electric demand, driven by electric vehicles (EVs) and the potential rise of electric ...

The case study focuses on rural distribution grids in Southern Germany, projecting the repercussions of different charging scenarios by 2040. Besides a Vehicle-to-Grid scenario, ...

The technology enables charging the batteries of electric vehicles and transferring the stored energy back to the stationary storage ...
