Should you run your air conditioner on solar?

The answer is a resounding yes. But it is followed by a very important "but." Running your lights, your TV, or your laptop on solar is simple. Running an air conditioner is a different beast entirely. It's a power-hungry appliance with a secret weapon that can bring lesser solar systems to their knees.

Will solar power fill my home's energy needs?

The Department of Energy says most homes with solar panels get at least 40% of their energy from solar; that varies by house. Whether solar power will fill all your power needs depends on how much your system produces and how much you use.

How does solar power affect your air conditioner?

Your air conditioner draws from this solar power first, only pulling from the grid if it needs more. Any excess solar power you generate is exported to the grid, often for credit. The Bottom Line: You are directly using sun power to run your AC, which can dramatically lower your electricity bill, especially in the summer.

Can a Homeowners Association restrict solar panels?

That usually means banning a homeowners association from restricting solar panels in a way that significantly affects the cost of solar or the solar panels' performance. Often, the laws let HOAs make reasonable requests for aesthetic or safety purposes. Solar access laws are generally set at the state, county, or city level.
