How do I calculate a route based on a base station?

Create a starting or base station on the route and enter the station values as an offset from that station. Identify a starting or base station on the route and enter the station values as an offset from that location. Use the preexisting stations on the route to calculate or enter the measures in the form of station values.

How to calculate base station coverage?

Look up the traffic per base station, as supplied by the base station manufacturer. 5. Divide 3. by 4. to get the number of base stations in your target area. 6. Situate the base stations strategically at the intersections of roads and railways, and at airports, schools, business areas and shopping malls to get a 95% coverage.

How do you calculate base station traffic?

Multiply 1. and 2. to get the traffic per target area. 4. Look up the traffic per base station, as supplied by the base station manufacturer. 5. Divide 3. by 4. to get the number of base stations in your target area. 6.

What is the distance between a baseline and a station?

Stations are reference points that are placed along the horizontal measurement of a route centerline or a baseline at some regular interval. Generally, the distance between two adjoining stations along a route is 100 feet. The first station located at the beginning of the baseline is 0+00, and the next station located 100 feet from it is 1+00.

Identify a starting or base station on the route and enter the station values as an offset from that location. Use the preexisting stations on the route to calculate or enter the measures in the ...

This page is a general guide to determine the number of M500 base stations that would be needed for your site. The initial release of the M500 will only support two base stations, but ...
