OverviewHistoryDevice structureApplicationsAdvantagesComparison with power MOSFETsModelingIGBT failure mechanismsThe bipolar point-contact transistor was invented in December 1947 at the Bell Telephone Laboratories by John Bardeen and Walter Brattain under the direction of William Shockley. The junction version known as the bipolar junction transistor (BJT), invented by Shockley in 1948. Later a similar thyristor was proposed by William Shockley in 1950 and developed in 1956 by power engineers at General Electric

Among the many types of transistors, IGBT devices hold a unique and indispensable place. Discrete IGBTs meet the needs of low- to medium-power systems, while ...

The IGBT is the most rugged and the strongest power device yet developed, affording ease of use and so displacing bipolar transistors and even gate turn-off thyristors (GTOs).

The modules are based on the latest Field Stop 7 (FS7) IGBT technology which delivers the highest levels of performance in high-power applications including solar inverters, ...
