What is the difference between battery cost and battery cost?

As a simple example, the price a buyer pays for a battery can be referred to as a battery cost (i.e., cost to the buyer), while the cost a manufacturer incurs to produce that battery--a distinct concept-- can also be referred to as a battery cost.

How is energy storage affecting battery costs?

Energy storage deployments grew by 50% year-over-year, driving demand and impacting battery costs. The demand for energy storage is rising rapidly, with deployments increasing by 50% year-over-year. This growth is being driven by the need for grid stability, renewable energy storage, and backup power solutions.

Are battery storage costs based on long-term planning models?

Battery storage costs have evolved rapidly over the past several years, necessitating an update to storage cost projections used in long-term planning models and other activities. This work documents the development of these projections, which are based on recent publications of storage costs.

Does battery storage cost reduce over time?

The projections are developed from an analysis of recent publications that include utility-scale storage costs. The suite of publications demonstrates wide variation in projected cost reductions for battery storage over time.
