---

In this work we answer several questions about the environmental impact of 5G deployment, including: Can we reuse minerals from discarded 4G base stations to build 5G or does 5G ...

Telecom equipment recycling helps prevent electronic waste and recover reusable materials from outdated communication systems. It's the process of safely collecting, ...

In the rapidly evolving world of telecommunications, upgrading equipment is a regular occurrence. But what happens to the old gear that's no longer needed? Simply discarding it isn't an option, ...

With communication infrastructure expanding at unprecedented rates, over 7 million tons of copper cable waste is generated annually from base station upgrades and decommissions.

Most of the equipment is lost to waste - not because they're broken, but because operators lack the data to reuse it safely. Across the industry, operators decommission or ...

Old communications equipment can contain potentially hazardous materials like mercury or lead, and need to be disposed of responsibly and safely so they do not harm the ...

As global 5G deployments accelerate, over 200,000 communication base stations become obsolete annually. What happens when cutting-edge infrastructure becomes electronic waste?

Repurposing spent batteries in communication base stations (CBSs) is a promising option to dispose massive spent lithium-ion batteries (LIBs) from electric vehicles (EVs), yet ...
