Silicon nitride layers have been long used as front side passivation layers for n-type silicon substrates. Here we explore the passivation property of silicon oxynitride (SiON) ...

The standard used for emitter passivation and antireflection coating of crystalline silicon solar cells in photovoltaic industry is a 70 nm-thick amorphous silicon nitride layer (in short SiN).

Optical and structural properties of silicon oxynitride deposited by Plasma Enhanced Chemical Vapor Deposition for photovoltaic

In this paper we investigate different rear stack systems of a thin thermally grown silicon oxide and PECVD silicon nitride and PECVD silicon oxide layers for rear surface ...

Silicon oxynitride is a versatile material used in many nanofabrication processes, including the fabrication of waveguiding devices, solar panels, and semiconductors.

In this paper we investigate different rear stack systems of a thin thermally grown silicon oxide and PECVD silicon nitride and PECVD ...

Solar cells with silicon oxynitride dielectric layers and methods of forming silicon oxynitride dielectric layers for solar cell fabrication are described herein.

SiN_x and SiO_xN_y layers deposited by the PECVD method are commonly used in silicon solar cells for their excellent thin film properties. In this study, we perform an ...
