-----

An aqueous zinc-sulfur battery (AZSB) represents a promising next-generation energy storage technology as a result of its salient features of safety, affordability, and ...

The promise of high-efficiency copper zinc tin sulfide or CZTS-based solar cells is hindered by critical challenges such as detrimental defects and problematic interfaces.

Zinc sulfide (ZnS), generated during discharge, is unstable in an acidic solution, undergoing a disproportionated reaction, limiting the use of acidic electrolytes in an Zn-S battery.

Each section addresses the advancements made in these areas and their potential for improving the overall efficiency and stability of Zn-S batteries. The chapter concludes by outlining recent ...

Aqueous zinc-sulfur decoupled batteries, as an innovative energy storage technology, demonstrate potential in enhancing energy density and cycle stability through their ...

Solar cells made from copper zinc tin sulfide (CZTS) have gained popularity as a possible low-cost and Earth-abundant alternative to copper indium gallium selenide (CIGS) cells.

Technological advancements are dramatically improving solar storage container performance while reducing costs. Next-generation thermal management systems maintain optimal ...

In a study published recently in *Angewandte Chemie*, researchers announced a significant step toward creating high-performance, low-cost zinc-sulfur batteries.
