---

Based on the optical transfer matrix, the transmission coefficients of different film layers were deduced. The theoretical calculations were then validated against the ...

Use full glass curtain walls on the sides instead of solid walls to maximize lateral illumination. Include motorized skylights on the roof for extra ventilation and direct overhead ...

The high-transmittance layout design offers solutions for project scenario such as sunroom, greenhouse, skywalk, glass roof, etc; Raytech offers product design and adhesive installation ...

The AAMA/NSA 2100 specifications provide definitions and minimum performance criteria for sunrooms and their components. The specifications also include minimum design criteria for ...

Many solar thermal energy conversion systems employ glass to reduce convective losses from the absorbing surface, increasing system efficiency. Glass is not perfectly transparent, with ...

Solar Transmittance value are calculated as described in section Weighting Factors. The data tables in both norms do not have equidistant data so that a trapezoidal weighting is applied.

The high-transmittance layout design offers solutions for project scenario such as sunroom, greenhouse, skywalk, glass roof, etc; Raytech offers ...

Properties for beam absorptance of the individual glass layers and screen/glass combination are derived in a similar fashion to the transmittance calculation described above.
