Optimize your solar power plant operations through accurate remote wind measurements and detailed, real-time insights. The industry's most trusted scanning lidar, Vaisala WindCube#174; ...

We explore both conventional approaches, such as deterministic and probabilistic methods, and advanced techniques, including optimization algorithms and simulation-based ...

Solar monitoring stations are automated data-acquisition systems specifically designed for the solar-energy industry's needs for research, resource assessment, and performance validation.

This paper presents an analysis of the results of wind speed measurements using Digital Anemometer Model AM-4203 and solar ...

For the optimal design of the hybrid system, wind speed and solar irradiance of the study area should be measured accurately over a period of a year. Then, distribution functions ...

In this article, we propose a methodology for sizing of hybrid power plants as an optimization problem that maximizes the net present values over capital expenditures and compares it with ...

This paper presents an analysis of the results of wind speed measurements using Digital Anemometer Model AM-4203 and solar power measurements using Digital Solar Power ...

This paper addresses the smart management and control of an independent hybrid system based on renewable energies.
