Under balanced three-phase system conditions, various conventional control methods were applied for controlling a grid-connected three-phase inverter, such as p

In this study, two different control systems are proposed for a three-phase, three-level, three-leg, three-wire (3P3L3L-3 W), grid-connected (GC) neutral point clamped (NPC) voltage source ...

By separating the control of active and reactive power, the control structure is made simpler and independent regulation of these parameters is possible. This improves the ...

It is simple to implement conventional current control with a proportional integral (PI) controller. However, system stability and ...

It is simple to implement conventional current control with a proportional integral (PI) controller. However, system stability and dynamic performance are not perfect, particularly ...

The proposed voltage controller has a PI Control structure, with adaptation of the gains depending on the observed error. In this way, the monitoring of the voltage reference ...

By separating the control of active and reactive power, the control structure is made simpler and independent regulation of these parameters is possible. This improves the inverter's capacity ...

Results suggest that while the boost converter with a PI-controlled inverter provides better efficiency and voltage regulation, the system without the boost converter, using PID control, ...
